

# Creating Value through the Benchmarking of Capital Projects

---

Measuring the relationships  
between

what you do

what you get

*IPA*

## Purpose of the Discussion

---

- n Discuss the progress of the process industries in capital effectiveness**
- n Explore primary drivers of project excellence**
- n Bring data to some contentious issues**

## Basis for the Discussion

---

**n** Each year Independent Project Analysis (IPA) conducts about 600 project evaluations for the process industries:

- ∅** oil (upstream and down)
- ∅** chemicals
- ∅** pharmaceuticals
- ∅** minerals
- ∅** consumer products
- ∅** power

**n** We now have databases containing over 5000 major projects and 1400 small projects

*IPA*

# Characteristics of the Databases

---

**Data for each project are quite detailed: over 1500 variables describe the projects from inception to completion**

**All data were obtained through face-to-face interviews with the project teams and sponsors in addition to the documentation**

**All data are normalized to a common time and place and external factors are removed**

**We then develop statistical models to create indexes for cost, schedule, operability, etc.**

*IPA*

# Outline

---

## *Progress in capital effectiveness*

- p** Keys to improvement
- p** The role of contracting strategies
  - ∅** Is fixed-price best?
  - ∅** Do incentives work?

# Progress

---

The cost of facilities has **improved** by about 12 percent in real terms over the past 5 years

Execution schedules have **improved** nearly 30 percent over the past decade

Construction safety has **improved** dramatically

Operability has held **steady**

# Cost Performance Is Improving

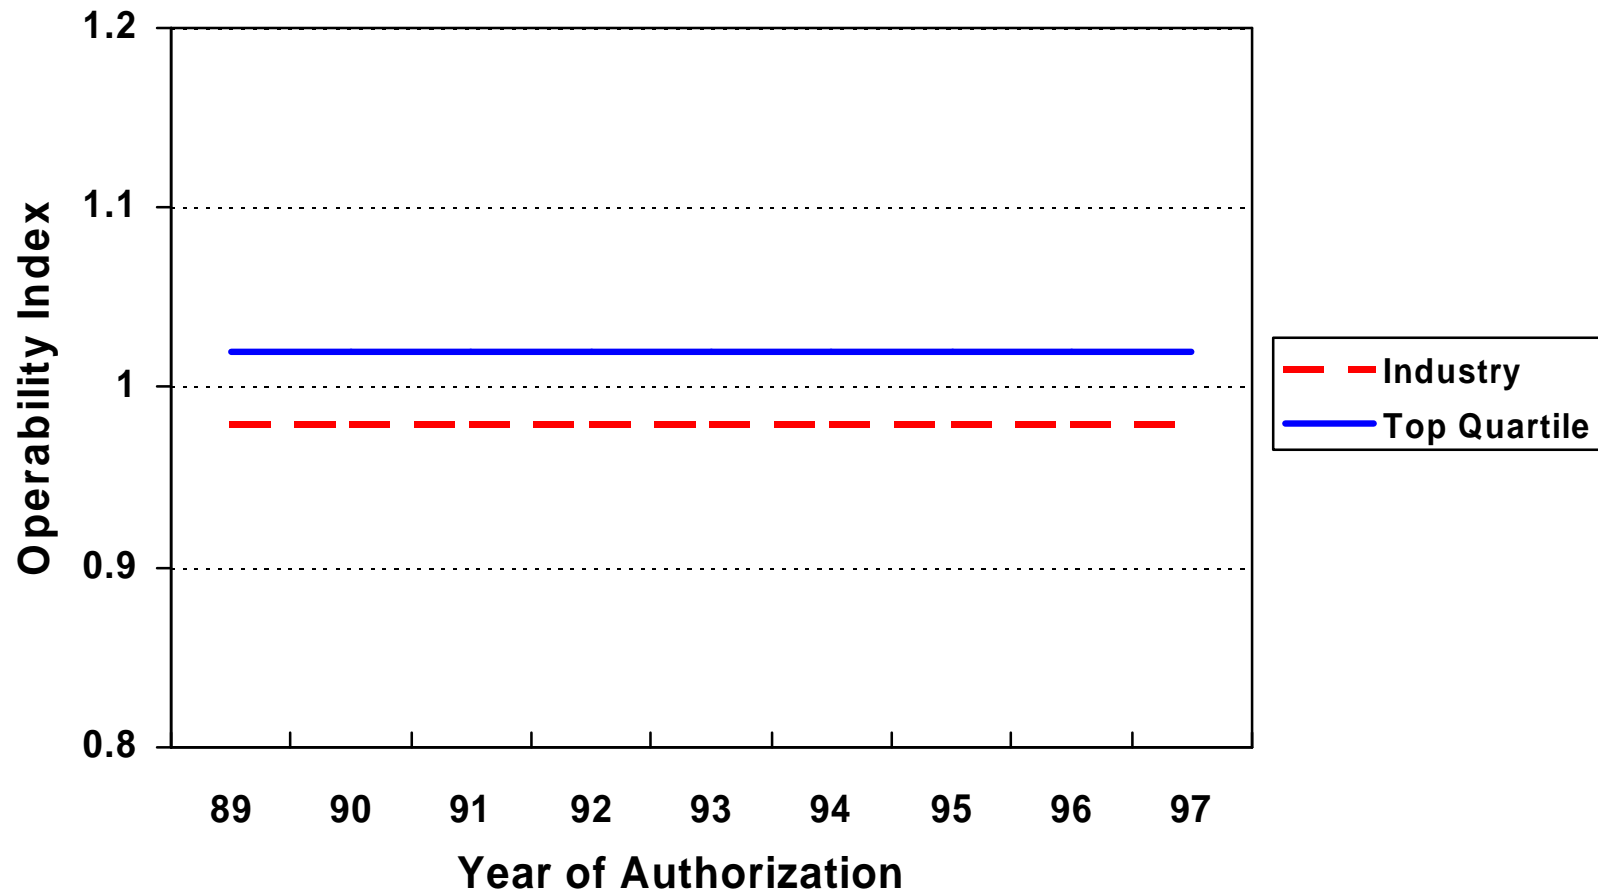

# Schedules Are Improving

# Operability Shows No Change

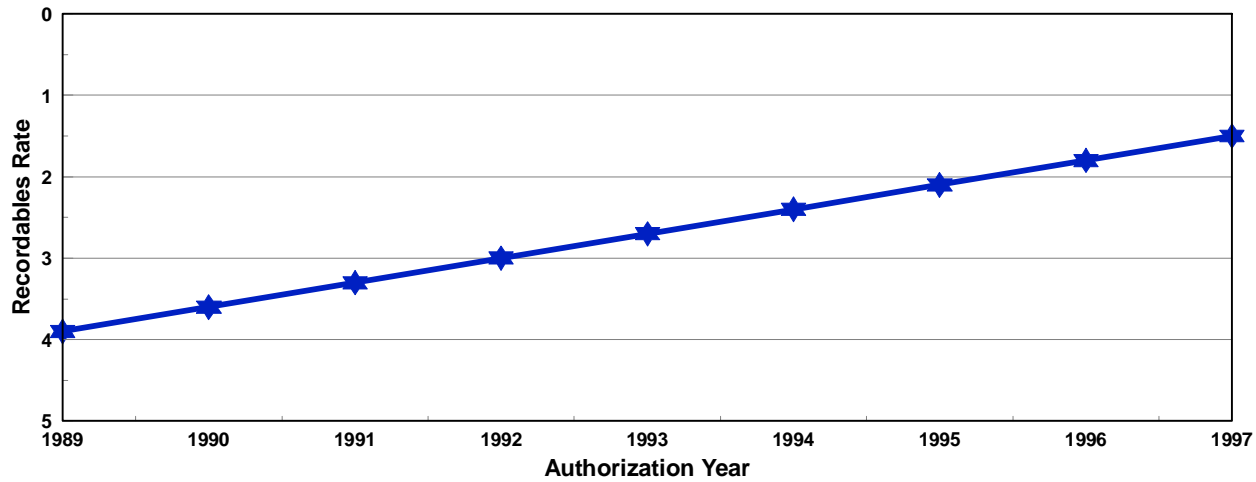

# Safety Performance is Improving

## Lost Time

## Total Recordables

# Elements of Capital Effectiveness

# Elements of Capital Effectiveness

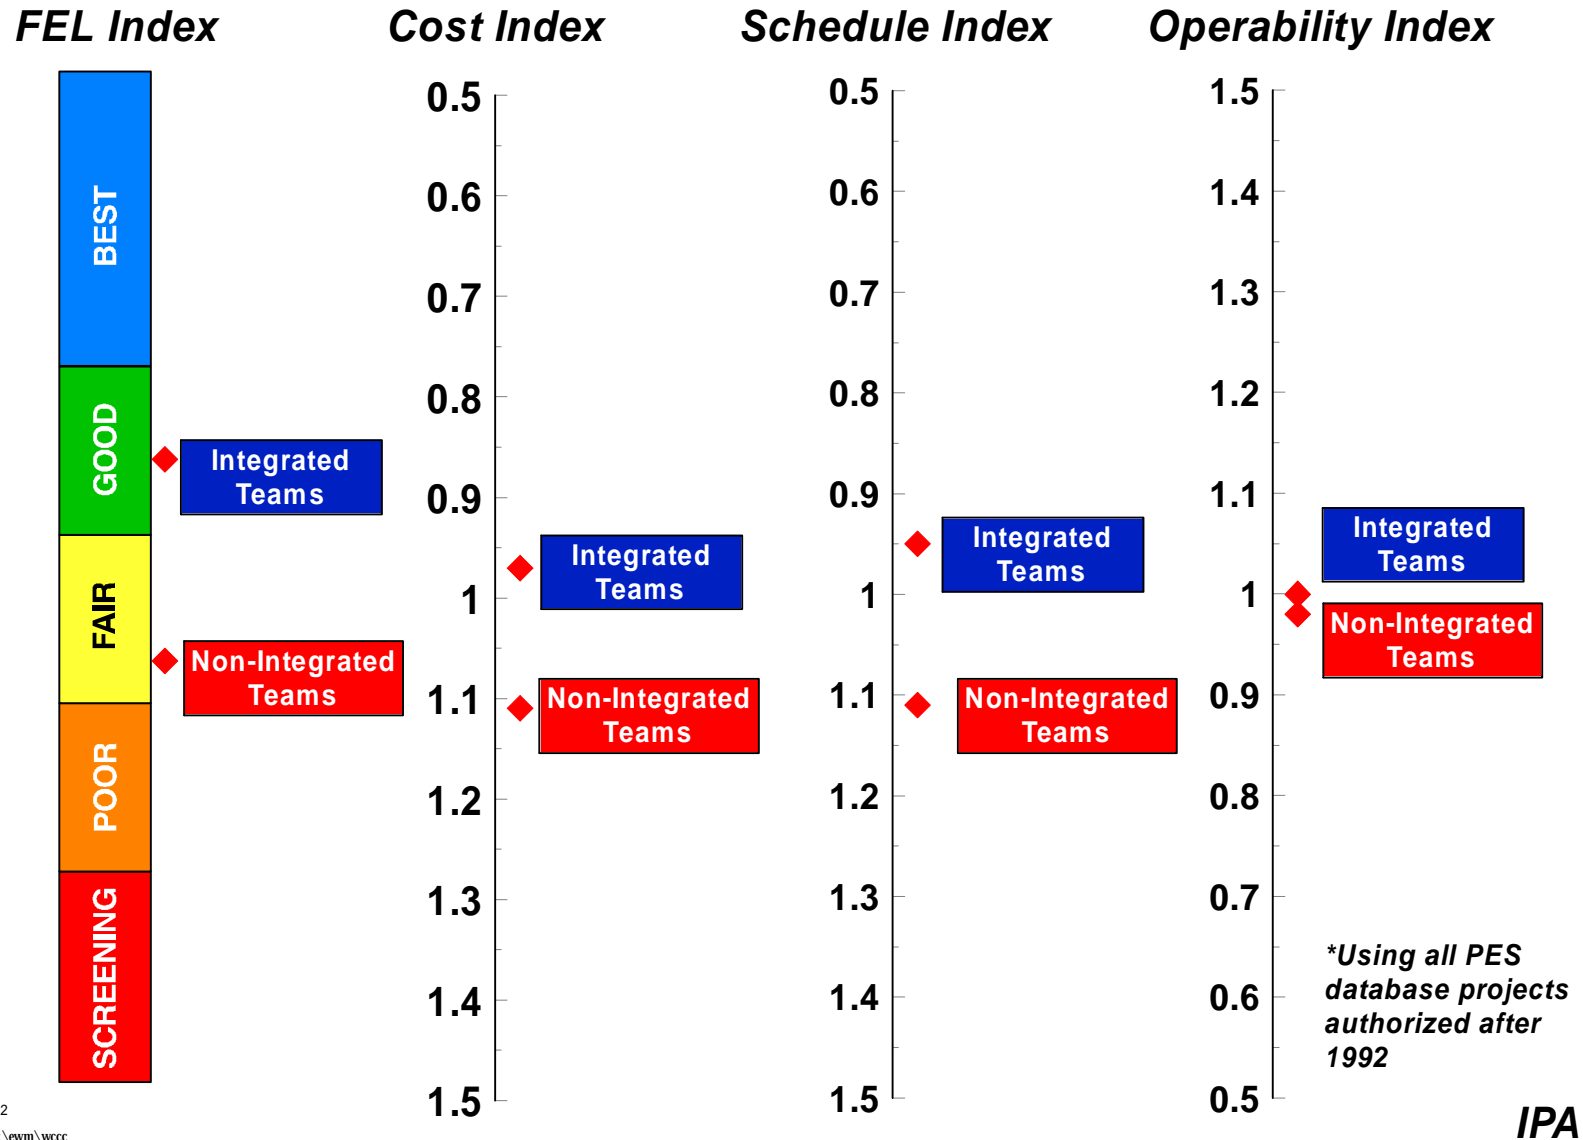

# Integrated Project Teams

---

## Definition of an Integrated Project Team

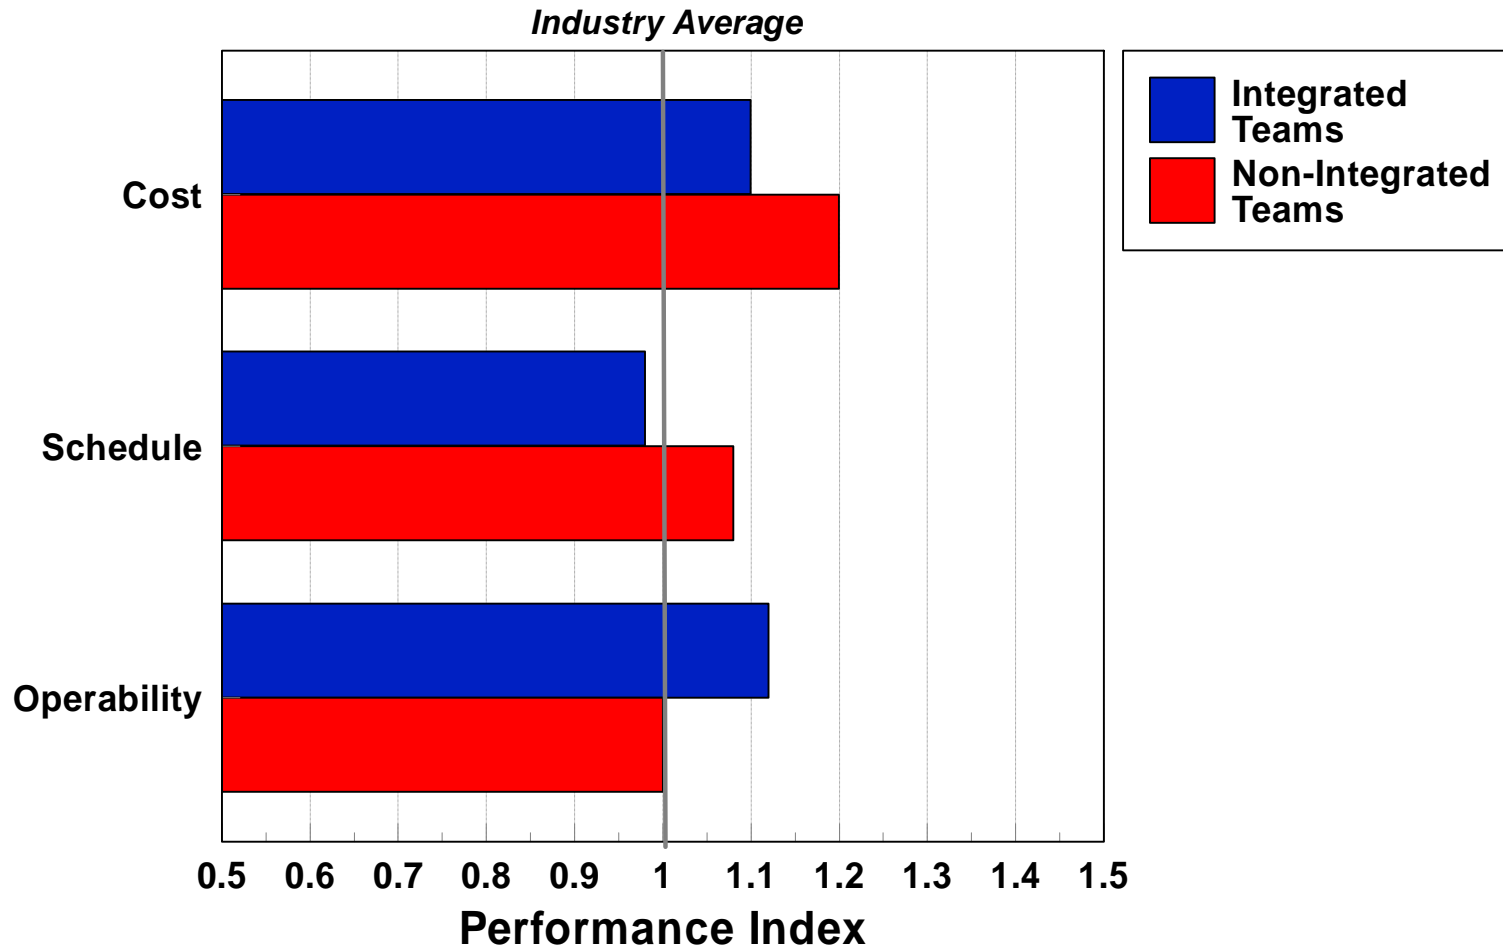

- n An Integrated Project Team is a team of full or part-time representatives of the following areas (but are not limited to):
  - ∅ Business
  - ∅ Engineering
  - ∅ Construction
  - ∅ Maintenance
  - ∅ Operations/Production
  - ∅ Health and Safety
  - ∅ Environmental (if needed)
  - ∅ Contractor (if appropriate)
  
- n These representatives are identified prior to project authorization and have specific responsibilities that are defined and understood by all team members
  
- n These representatives have authority to make decisions for the function they are representing and provide functional input to the project manager.

# Integrated Teams Result in Better FEL and Therefore Better Performance

# Integrated Teams Even Help Projects With Poor FEL

# Elements of Capital Effectiveness

# Components of Front-End Loading

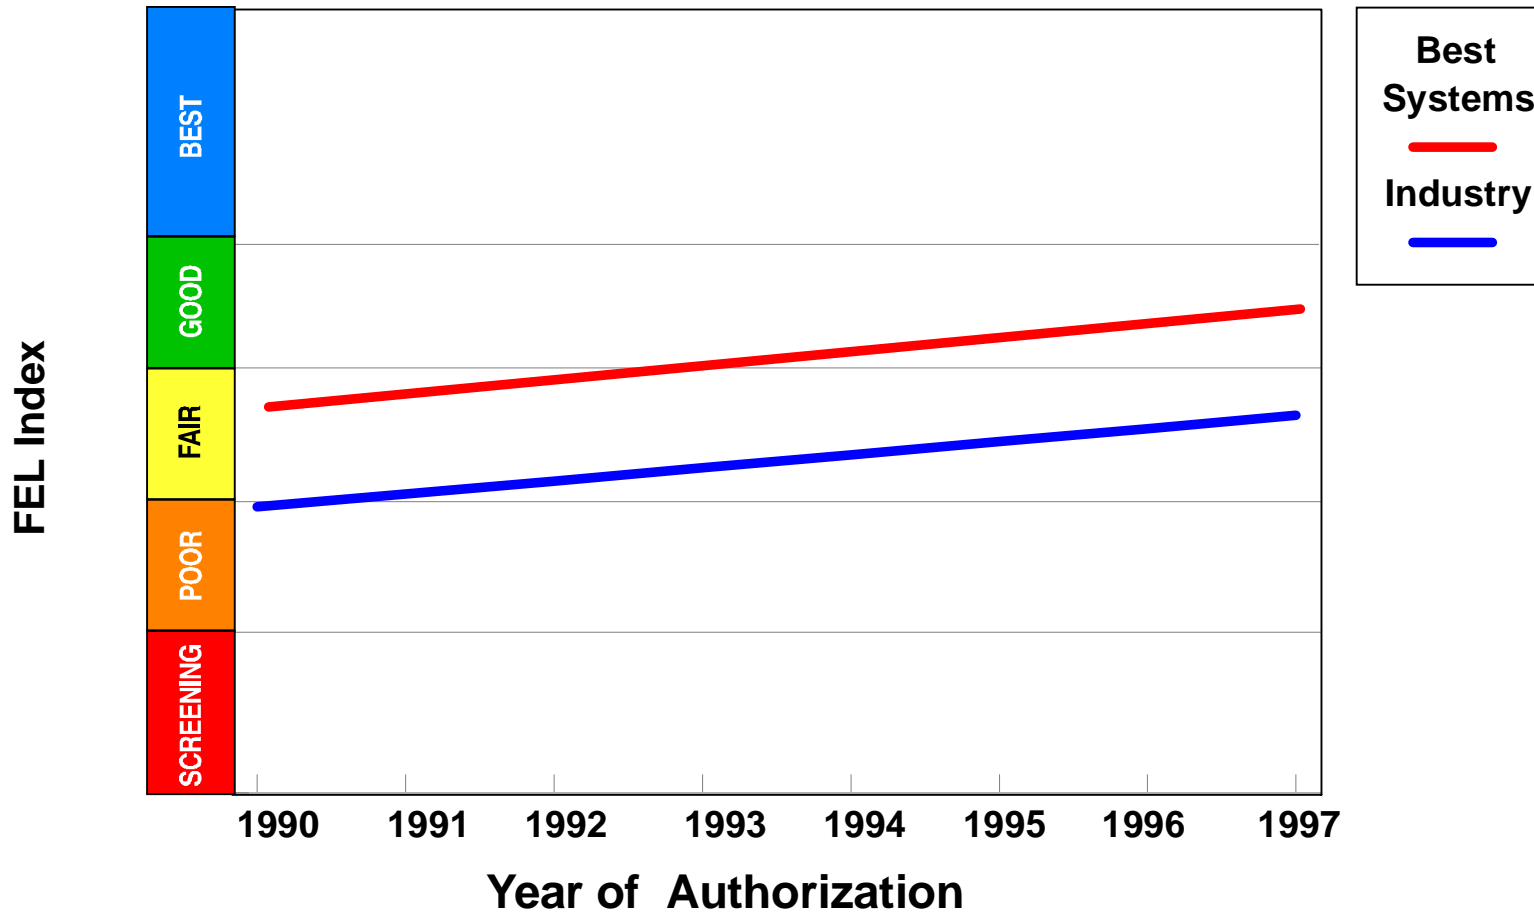

- Local labor cost and productivity
- 
- Materials availability
- 
- Equipment layout
- 
- Soils data
- 
- Environmental requirements
- 
- Health & safety requirements

- Engineering tasks
  - Detailed scope
  - Feedstock/product properties
  - PFDs
  - H&MBs
  - P&IDs
  - One-line elec. diagrams
  - Major equipment specs
  - Cost Estimate
- Participation/buy-in of:
  - Operations
  - Maintenance
  - Business

- Contracting strategy
  - Who
  - How
- Team participants & roles
- Integrated schedule
  - Critical path items
  - Identification of shut-downs for tie-ins
  - Resource requirements
  - Overtime requirements
- Plans
  - Commissioning
  - Startup
  - Operation
  - Quality assurance
- Cost/schedule controls

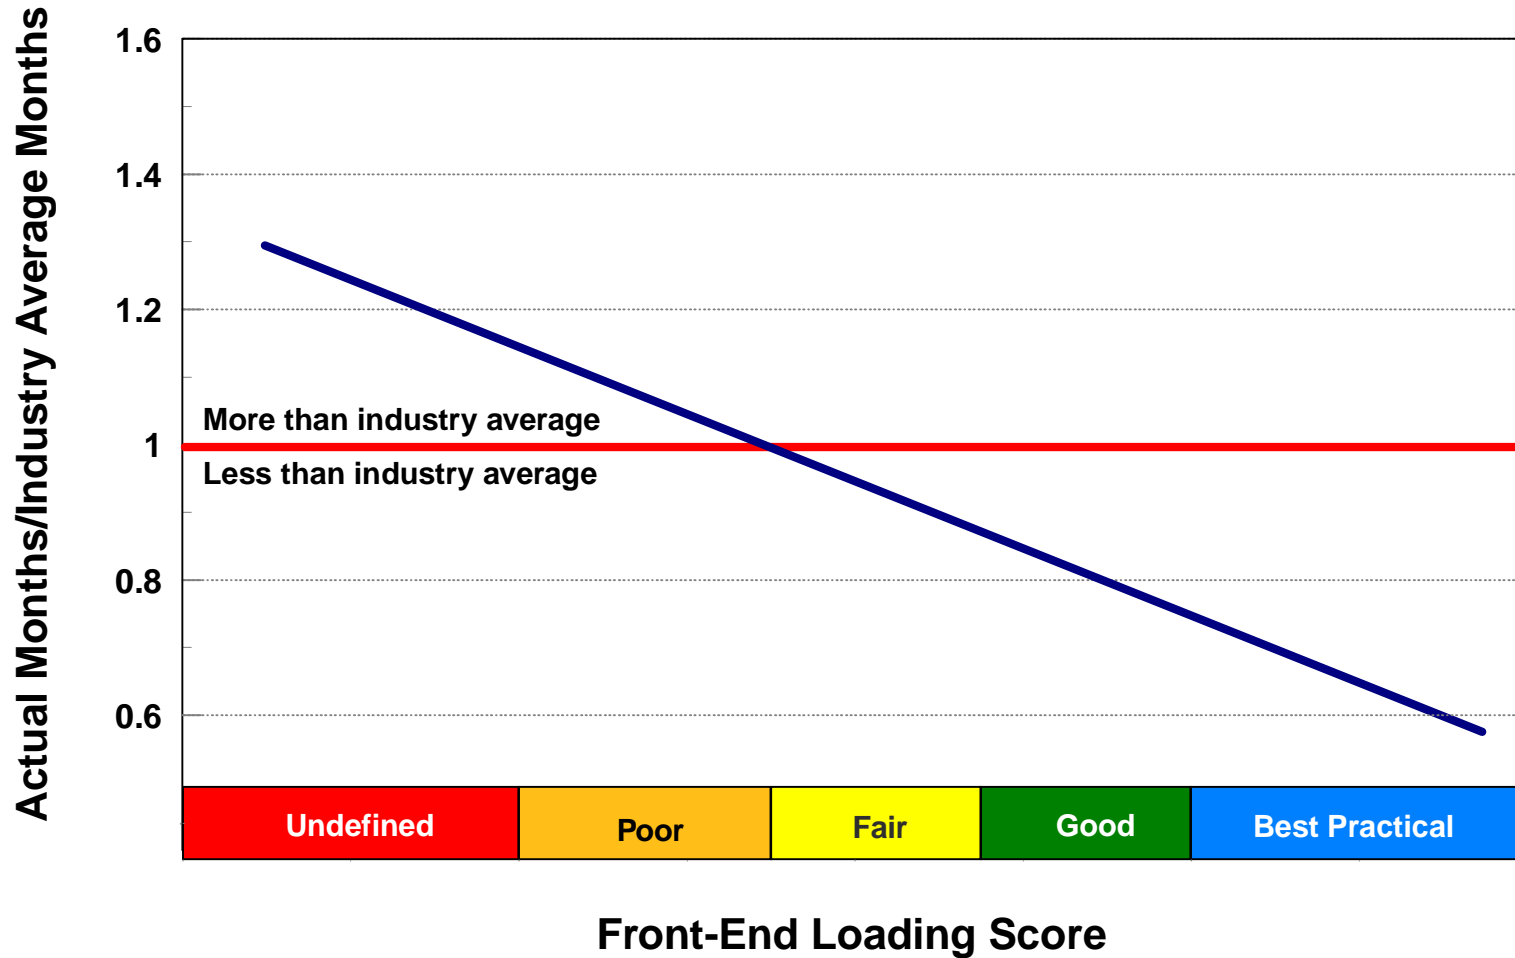

# FEL is Improving Slowly

# Few Projects Meet All Objectives

## Why is Capital Effectiveness So Difficult?

---

- n In capital intensive businesses, capital effectiveness is an avenue to success
  - ∅ low cost producers have some volume, margin, and market share control
  - ∅ cycles provide opportunities as well as headaches
- n Yet many commodity businesses waste large amount of capital, because...
  - 🚩 work process is **inadequate**
  - 🚩 accountability is **poor**
  - 🚩 cross-functional cooperation is **lacking**

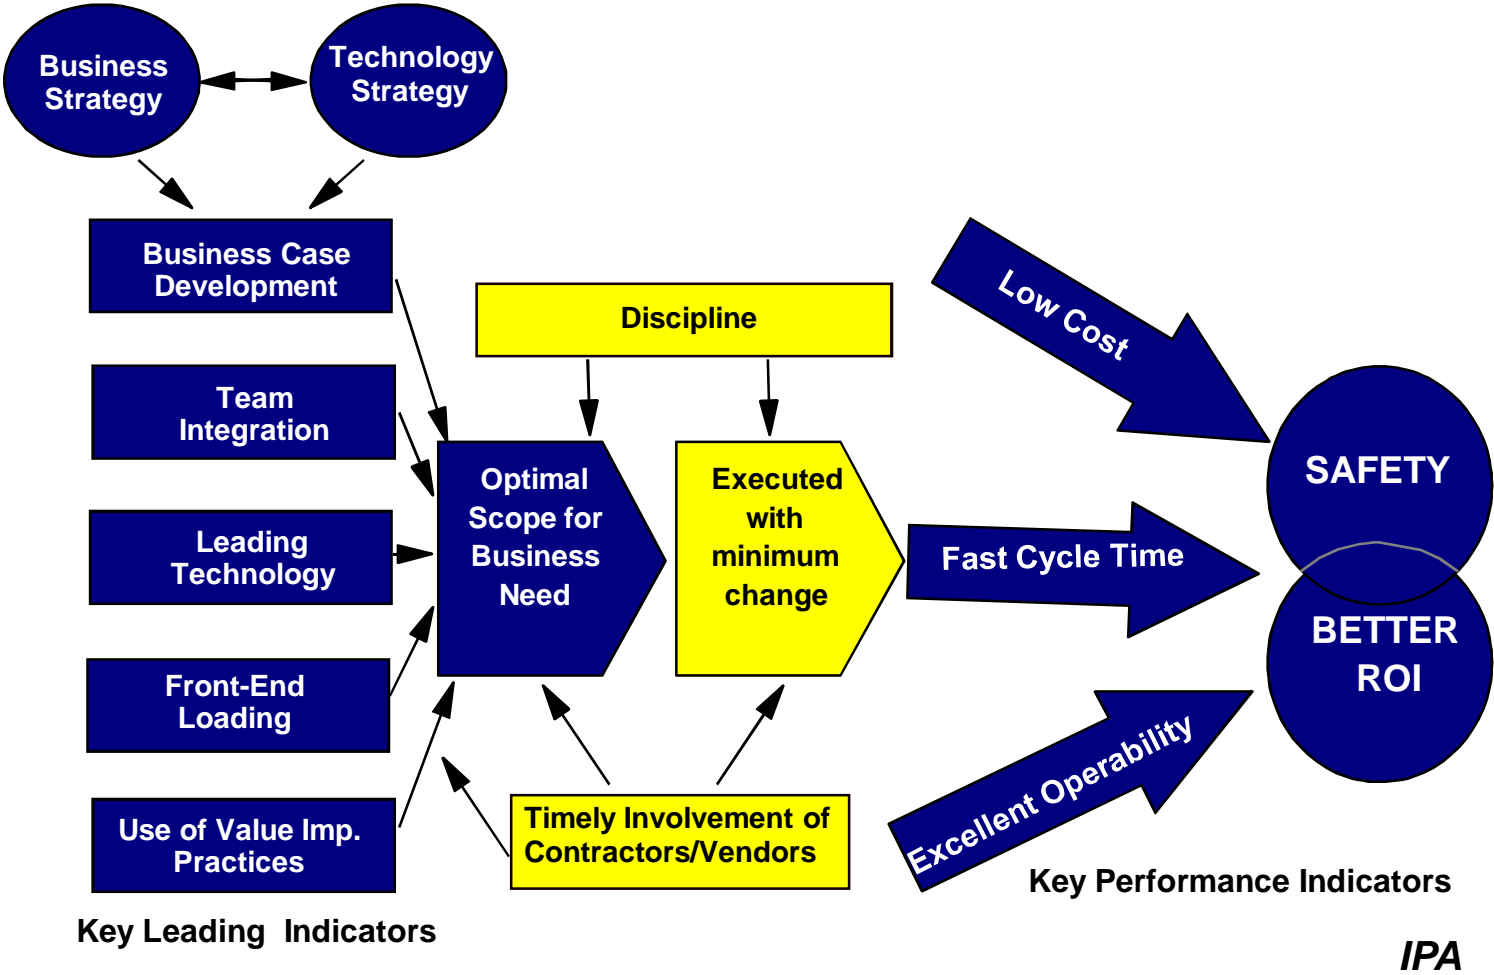

# Outline

  - ∅ Do incentives work?**

# Elements of Capital Effectiveness

# The Contracting Strategy Problem

---

- n** There are strongly held, diametrically opposed beliefs about the relative merits of different contracting approaches
- n** In general, these beliefs are unsupported by systematic data
- n** The contracting problem is also confused by the inability of many to distinguish between
  - ∅** predictability and
  - ∅** effectiveness

- p Keys to improvement**
- p The role of contracting strategies**
  - ∅ Is fixed-price best?**
  - ∅ Do incentives work?**

## Contract Approaches Examined

---

- n **EPC Lump-sum:** detailed engineering, procurement and construction performed on a fixed price basis by same firm or consortium
- n **Reimbursable:** all work performed on a cost-plus fee or cost-plus incentive fee basis
- n **Mixed:** engineering & procurement performed on a reimbursable basis with predominantly fixed-price construction
- n **Results are controlled** for definition; poorly defined EPC-lump sums have very large penalty

# Contracting Strategy and Project Results

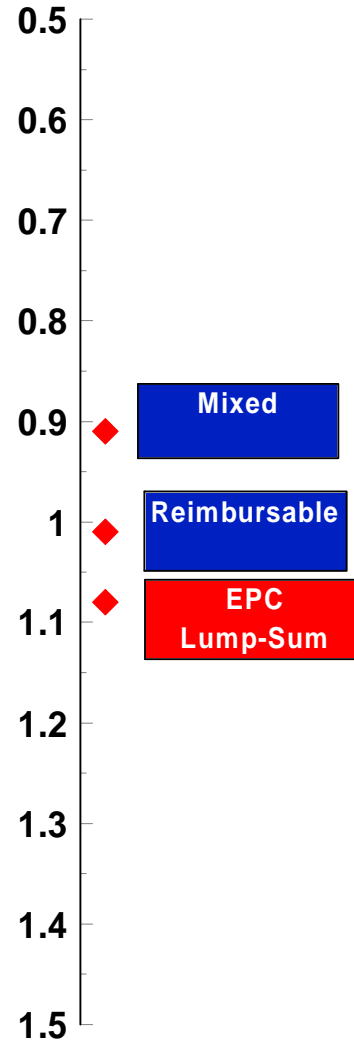

**Cost Index**

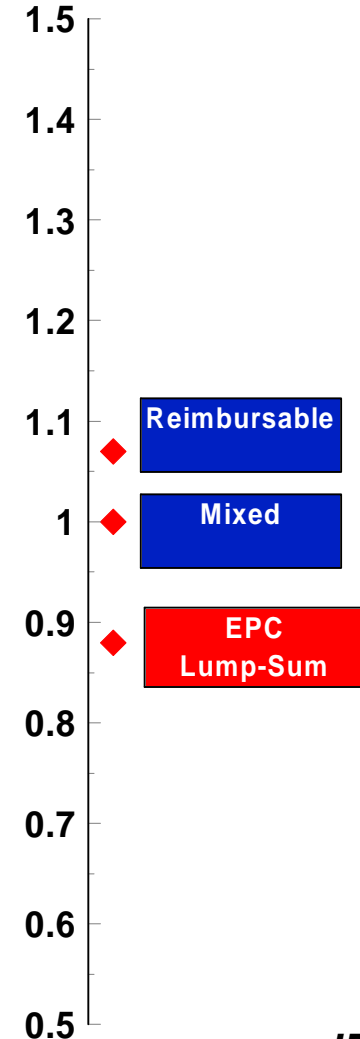

**Schedule Index**

**Cycle Time**

**Operability Index**

A vertical color bar on the left side of the slide, transitioning from red at the top to blue in the middle, and back to red at the bottom, with a grey bar to its right.

## Contracting Strategy Results

---

- n EPC Lump-sum is on average significantly more expensive than average**
- n Reimbursable engineering followed by any form of fixed price construction (the "mixed strategy") is the most cost-effective approach**
- n Although Mixed strategy execution time is longer, the cycle time is shortest**
- n EPC Lump-sum carries a heavy operability penalty**
- n On average the Mixed strategy appears best and EPC lump-sum worst**

*IPA*

## **Why are EPC Lump-sums more Costly?**

---

- n This contract form seeks to shift risk to the contractor**
- n Theory is that because contractors lead execution, they should be better able to control risk**
- n However, contractors are not well-capitalized and cannot bear equity risks at low cost**
- n Therefore, contractors will normally bid on a higher than 50/50 basis**
- n The larger the project relative to contractor, the high the risk premium**

# Outline

---

- p Progress in capital effectiveness**
- p Keys to improvement**
- p The role of contracting strategies**
  - ∅ Is fixed-price best?**
  - ∅ Do incentives work?**

## The Role of Incentives

---

- n ***Engineering incentives*** were amounts paid to the engineering contractor according to a formula for results versus targets
- n ***Construction incentives*** were paid to the construction contractor
- n ***"Both"*** are projects in which incentives were provided to both the engineering and construction contractors or to a single EPC contractor for overall cost and schedule results
- n Too few contracts had *meaningful* provisions for operability incentives to be examined

# Conclusions about Incentives

---

- n** The use of incentive contracting has no reliable effects on cost, execution time, or cycle time
- n** Directionally the results are poorer rather than better with incentives
- n** The use of incentives for engineering is strongly associated with *poorer* operability of facilities
- n** This conclusion holds for all types of projects we have examined
- n** The use of incentives as currently practiced should be reconsidered
- n** Contractors are better at this than owners

## If You Incentivize, Ask...

---

- n Exactly, whose behavior are you seeking to change? How will the change mechanism work?**
- n Will engineers withhold good ideas unless their firm receives an incentive?**
- n Are there ways that the incentive can be "gamed", e.g. high estimates?**
- n Are there potential unintended consequences, e.g. managing to the incentives rather than the project?**
